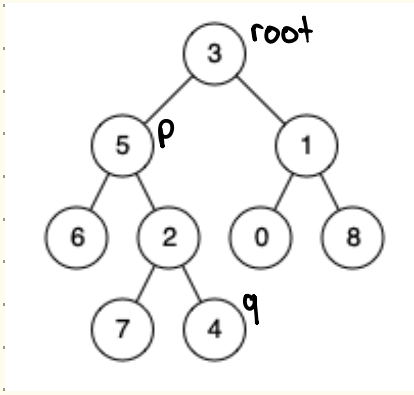
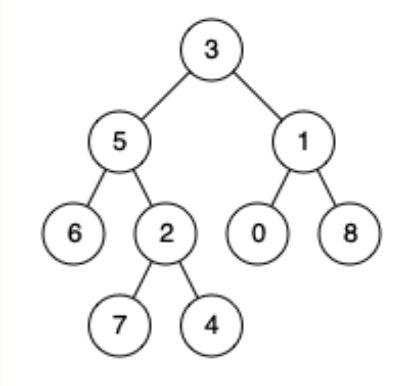
236 - Lowest Common Ancestor In A Binary Tree





```
dfs(root: Optional[TreeNode]) -> Result(node,
    None -> (None, 0)
    _ -> (lca_node, found)
        left = dfs(root.left)
        right = dfs(root.right
        if left.found == 2:
            return left
        if right.found == 2:
            return right
        found = (1 if root is p/q
                 0 else)
                + left.found
                + right.found
        if found == 2:
            return (node, found)
        return (None, found)
```
