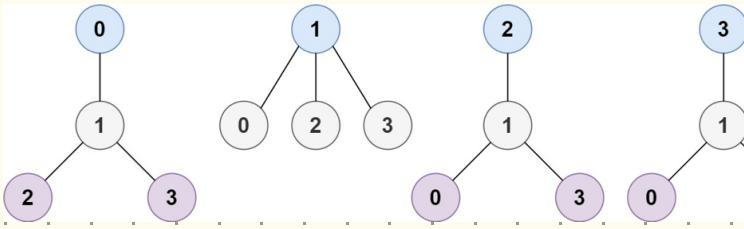
310 - Minimum Height Trees

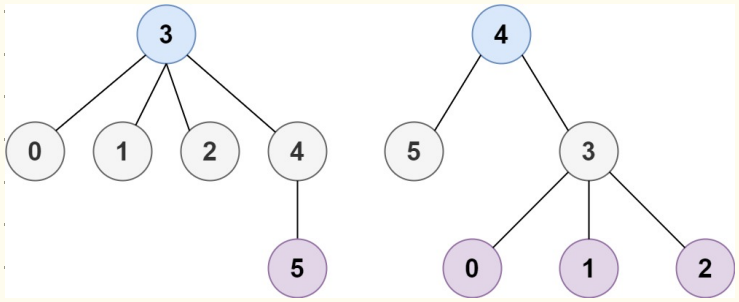
- n nodes labeled 0 to n - 1
- n - 1 edges



edges[i] = [a, b] non-directed edge

When selecting x as root, tree has height h.

Return a list of all MHT root labels



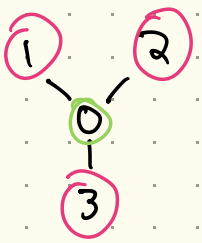
BF: Calculate height for every root label

TC: $O(n^2)$ SC: $O(h)$

Intuition:

- MHT is the middle node(s)
- Topological Sort: iteratively remove all leaves layer by layer

⓪ Build Adjacency List list[set[int]]

① leaf = all nodes w/ 1 edge


② when 2 nodes or less in the graph remain, these 2 nodes are the MHTs.
